STATE OF NEW YORK

IN SENATE

JANUARY 1892

REPORT OF THE

COMMISSIONER

OF THE

LAND OFFICE

IN RESPONSE TO A

RESOLUTION

PASSED BY THE SENATE

APRIL 1891

ALBANY

1892

INTRODUCTION

The Eleventh Bulletin of North Carolina Morbidity Statistics, covering the calendar year 1942, contains tabulations similar to those found in previous bulletins.

For the entire year only 66,775 cases were reported to this Department as compared with 92,961 for 1941. It is felt that this decrease was due to the usual periodic decline in certain childhood diseases as well as to a decline in reporting. The emergency created by the war is known to have placed a heavy burden on those physicians now practicing in civil life in North Carolina. It is realized that this makes prompt reporting more difficult than before the war; however, it is hoped that this decline in reporting has now reached its lowest level.

There are 35 diseases that are reportable by law in North Carolina. Several of these showed a definite decrease in reported incidence in 1942 as compared with 1941. German measles case reports declined from 12,769 in 1941 to 331 in 1942, measles from 27,764 to 21,581, poliomyelitis from 168 to 82, diphtheria from 1,629 to 1,187, whooping cough from 10,933 to 5,557, influenza from 5,837 to 673, pellagra from 60 to 20, septic sore throat from 139 to 109, syphilis from 17,560 to 16,713, tuberculosis from 2,425 to 1,902, typhoid fever from 197 to 181.

The following diseases showed an increase in reported incidence in 1942 as compared with the preceding year: Chancroid reports rose from 223 in 1941 to 635 in 1942, chicken pox from 4,726 to 5,063, endemic typhus fever from 78 to 100, gonorrhea from 5,805 to 9,620, Rocky Mountain spotted fever from 20 to 35, scarlet fever from 2,165 to 2,570.

It is encouraging to observe that in 1942 syphilis case reports declined to the extent of almost a thousand over the number reported in 1941. Until recent years the venereal disease control program in North Carolina was directed almost entirely at eradicating syphilis. It is felt that the intensity of this early program is now reflected in the gradually decreasing incidence of the disease. In a like manner, it is believed that the definite increase in 1942 in the reported incidence of gonorrhea and chancroid may be attributed to the increasing emphasis on the control of these diseases, especially of gonorrhea. This increase may well be an indication that many cases are no longer undiagnosed and unreported and that new cases are receiving aroused interest from the public as well as from the practicing physician.
